

The operating pipeline

Every path the system can take in a session: the scheduler waking itself, discovery, market data, the three intraday books running their own gate stacks in parallel, the single approval spine they all funnel through, the firewall work that closes the day, and the earnings book that runs on its own loop outside all of it. Nothing here waits for a human.

Redrawn 1 Sep against the working tree's `config/default.yaml`, `judged.yaml` and the three strategy params files – not against the previous drawing. Boxes marked Δ changed during a live trading session and carry the date they changed. The running agent holds its modules in memory, so it picks up a change only on restart.

01 · THE LOOP WAKES ITSELF

02 · 09:15 DISCOVER – ALPACA-NATIVE, NO SCRAPER

03 · MARKET CONTEXT – PER SYMBOL, THREADED, 190 REQ/MIN CEILING

04 · THREE BOOKS, THREE GATE STACKS, RUN IN PARALLEL – HARD ON CARRY, TWO HARD + A VOTE ON INTRADAY

05 · ONE APPROVAL SPINE – EVERY BOOK FUNNELS THROUGH IT

06 · MANAGEMENT – EACH POSITION IS ROUTED BACK TO THE STRATEGY THAT OPENED IT

07 · CLOSING THE DAY – LIQUIDATION IS CONFIRMED, NOT REQUESTED

08 · THE EARNINGS BOOK – A SEPARATE LOOP, OUTSIDE THE FIREWALL · ADDED 29–30 AUG

The other three books wait for a market condition to cross a threshold, and the recurring failure is that it never crosses. This one opens on a date: Broadcom reports on 2 September whether or not any indicator agrees.

04:00–16:00 events_watch (hourly, confirmed names inside the 3-day window) · 09:45 events_flatten – into the post-print IV collapse, BEFORE the day books compete for the same buying power
15:50 events_arm – the session before an after-close print · 15:55 no_entry_after, a late-arm guard added 30 Aug · 10:30 hard_exit_time

What this book does not have
No usable backtest – four reactions per name is a ranking device, not an edge estimate. · No historical option quotes, so the modelled spread is an assumption.
No intraday management: opened once, closed once. · The ATR stop cannot be watched overnight – the gap through it is the risk the position exists to take.
Δ 31 Aug: two judged runners were found live at once. Nothing surfaced it, and two arm cycles would have sent two orders against one nightly budget. There is still no singleton guard.

Evidence pack is third-party text: it arrives inside <<<EVIDENCE>>> markers named as untrusted, stripped and truncated, and every field of the response is clamped against a fixed schema.
